Sunfire™

High Resolution Series Subwoofer

HRS-8, HRS-10, and HRS-12

User's Manual

The lightning flash with arrowhead symbol within an equilateral triangle is intended to alert the user to the presence of uninsulated "dangerous voltage" within the product's enclosure, that may be of sufficient magnitude to constitute a risk of electric shock to persons.

The exclamation point within an equilateral triangle is intended to alert the user of the presence of important operating and maintenance (servicing) instructions in the literature accompanying the appliance.

Important Safety Instructions

1. Read Instructions
2. Keep these Instructions
3. Heed all Warnings.
4. Follow all Instructions
5. Do not use this apparatus near water.
6. Clean only with dry cloth.
7. Do not install near any heat sources such as radiators, heat registers, stoves, or other apparatus (including amplifiers) that produce heat.
8. Unplug this apparatus during lightning storms or when unused for long periods of time.
9. Refer all servicing to qualified service personnel. Servicing is required when the apparatus has been damaged in any way, such as a power-supply cord or plug is damaged, liquid has been spilled or objects have fallen into the apparatus, the apparatus has been exposed to rain or moisture, does not operate normally, or has been dropped.
10. Ventilation — The apparatus should be situated so that its location or position does not interfere with its proper ventilation. For example, the apparatus should not be situated on a bed, sofa, rug, or similar surface that may block any ventilation openings; or placed in a built-in installation such as a bookcase, cabinet, or closed equipment rack that may impede the flow of air through ventilation openings.
11. Power Sources — The apparatus should be connected to a power supply only of the type described in these operation instructions or as marked on the apparatus.
12. Power Cord Protection — Power-supply cords should be routed so that they are not likely to be walked upon or pinched by items placed upon or against them, paying particular attention to cords at plugs, convenience

receptacles, and the point where they exit the apparatus.

13. Non-use Periods—The power cord of the apparatus should be unplugged from the outlet when unused for a long period of time.
14. Object and Liquid Entry — Care should be taken so that objects do not fall into and liquids are not spilled into the inside of the apparatus.
15. Servicing — The user should not attempt to service the apparatus beyond those means described in this operating manual. All other servicing should be referred to qualified service personnel.
16. To Prevent Electric Shock, do not use this polarized plug with an extension cord, receptacle or other outlet unless the blades can be fully inserted to prevent blade exposure.
Pour prévenir les chocs électriques ne pas utiliser cette fiche polarisée avec un prolongateur, un prise de courant ou une autre sortie de courant, sauf si les lames peuvent être insérées à fond sans laisser aucune partie à découvert.
17. Grounding or Polarization — Precautions should be taken so that the grounding or polarization means of the Component is not defeated.

This apparatus does not exceed the Class A/Class B (whichever is applicable) limits for radio noise emissions from digital apparatus as set out in the radio interference regulations of the Canadian Department of Communications.

ATTENTION — Le présent appareil numérique n'émet pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques de class A/de class B (selon le cas) prescrites dans le règlement sur le brouillage radioélectrique édicté par les ministere des communications du Canada.

18. This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation.

If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the

equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:
 Reorient or relocate the receiving antenna.
 Increase the separation between the equipment and receiver.
 Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
 Consult the dealer or an experienced radio/TV technician for help.

19. Caution: Changes or modifications not expressly approved by Sunfire could void the user's authority to operate this equipment.

	<p>WARNING: THIS SUBWOOFER IS CAPABLE OF PRODUCING VERY HIGH SOUND PRESSURE LEVELS. YOU MUST TAKE EVERY PRECAUTION TO PROTECT YOUR HEARING FROM PERMANENT DAMAGE.</p>

Introduction

Thank you for purchasing a Sunfire High Resolution Series Subwoofer. We hope you enjoy it and the music it makes as much as we have enjoyed creating it for you.

The big breakthrough features of the subwoofer are its uncanny 1,000W Tracking Downconverter amplifier, and its long throw, High Back-emf woofer. These powerful forces combine to produce as much bass as several 15 inch drivers mounted in a cabinet the size of a small refrigerator! And, the High Resolution Series' extended frequency response means that your subwoofer is the perfect match to virtually any loudspeaker.

Unpacking

Your Sunfire subwoofer should reach you in perfect condition. If you do notice any shipping damage, please contact your Sunfire Dealer immediately.

Gently lift out the unit and remove all the packing material. It is important to save all the packing materials and the box in case your subwoofer ever needs to be moved or shipped for repair.

Make sure that you keep your sales receipt. It is the only way to establish the duration of your Limited Warranty and it may come in useful for insurance purposes.

Please take a moment to fill out and mail the Sunfire Customer Response card. Also read the serial number located on the control panel and record it here:

Serial Number:

Purchased from:

Date:

Features

- Patented high-pressure, High Back-emf, extra-long-throw design
- High efficiency Tracking Downconverter amplifier
- Low distortion
- Premium quality driver
- Extremely compact size
- Automatic signal-sensing turn-on and standby mode
- Line-level inputs
- Speaker-level binding post inputs
- Line-level high-pass outputs
- Phase control
- Crossover frequency control
- Volume control
- Soft clipping circuit allows graceful overload and prevents speaker damage due to clipping

Care

To maintain the speaker cabinet's finish, first unplug the power cord and then use a soft cloth to clean the surfaces.

If your Sunfire subwoofer needs servicing, please read the troubleshooting section on page 21. If a problem persists, contact your nearest authorized Sunfire Dealer.

Overview

The Sunfire HRS subwoofers are designed to give you the best possible low-frequency sound quality for your Home Theater and music playback experience. They incorporate a tremendously powerful built-in amplifier to produce tight, seismic, denture-rumbling bass that you can feel as well as hear.

There are three models in the high resolution series: the HRS-8, HRS-10, and the HRS-12. (The number represents the driver diameter in inches.) The control panel, connections and operation are the same for each subwoofer model, and this manual covers all three models.

Each subwoofer has controls for adjusting the crossover frequency, phase, and volume. They also have line-level and speaker-level inputs for easy incorporation into existing systems, or as part of a subwoofer/satellite speaker combination.

The Driver

To have lots of bass requires the movement of lots of air. To achieve this, the subwoofer's driver has been designed to travel back and forth approximately five times further than a normal driver. This gives lots of air movement and massive bass performance.

The Tracking Downconverter Amplifier

The large movement range of the driver generates greater air pressure inside the box than a conventional driver. In order to create this range of movement, we designed a drive amplifier that is much more powerful than an ordinary amplifier.

A signal compressor circuit kicks in automatically if the input signal level reaches a level that would overload the driver. This maintains a ceiling on the output without clipping.

If the input signal is driven even further, a 'soft clipping' circuit is enabled. This allows the driver to put more sound into the room to satiate the power hungry user, but without distortion or damage to the driver. This produces extremely high sound pressure levels (SPL) in your room without the driver banging against its mechanical stops.

Sub/LFE

In this manual, the term "Sub/LFE" is used to denote the subwoofer or Low Frequency Effects output, commonly found on Home Theater processors and receivers.

Control Panel Features

1. Power Indicator

This light is bright when the subwoofer is on, and dim when the subwoofer is in standby mode.

2. Power Switch

Press the top of this rocker switch to turn on the subwoofer.

The subwoofer has an automatic signal-detection circuit. After approximately fifteen minutes with no signal, the subwoofer will go into its quiet standby mode. The presence of an audio signal will turn it back on.

Normally you can leave the switch on, and let the subwoofer turn on when an audio signal is present, or off when it's not.

At night, or if you go out, or on vacation, you can press the bottom of the power switch to turn the subwoofer off.

3. IEC Power Connector

The subwoofer comes with a detachable linecord that attaches here. Make sure it is firmly pushed into place.

Connect the other end to an AC outlet that is properly configured for the type of plug and has the correct voltage for your model.

4. AC Line Fuse

The subwoofer is supplied with a conservative slow-blow type fuse to protect the electronics. If this fuse fails, replace it with the exact same type and current rating for your local AC voltage, as marked on the control panel near the fuse holder.

Note: Always unplug the power cord from your AC outlet before removing the fuse. To replace or inspect the fuse, use a small flat-ended screwdriver to gently pry out the fuse carrier and fuse.

5. Speaker-Level Inputs

If you are using a receiver which only has speaker-level outputs, you can connect it using the speaker-level inputs (see the hookup diagram on page 14). They can accept bare wire, banana, or dual-banana connectors.

If you experience excessive noise or hum using the line-level inputs, try using the speaker-level inputs. This may lower the background noise level.

6. Line-Level Inputs

These connect with RCA type cables from the line-level outputs of your receiver or preamp. Here are two examples:

If your processor or receiver has a single subwoofer output, connect it to the subwoofer's left input jack (see page 11). There is no need to use the subwoofer's right input jack.

If your processor does not have a subwoofer output, use "Y" adapters at the processor outputs (see page 12). In this way, you can send the processor's full-range output signals to your main amplifier and to the subwoofer at the same time.

7. High-Pass Outputs

Signals from these output jacks are a direct copy of the signals going into the input jacks of the subwoofer, with the exception that the bass below 70 Hz has been removed by a fixed high-pass crossover circuit. This handy feature lets the subwoofer control all the bass in your system, and you can use an external amplifier and smaller satellite speakers to control the mids and highs. (See the hookup diagram on page 13.)

We recommend using this high-pass function with small main/satellite speakers that are not designed to reproduce low frequencies. If you are used to the sound from smaller speakers, this option will really bring your system alive.

If your main speakers are capable of operating full range, you will not need to use the high-pass function.

8. Crossover Frequency

This controls the crossover frequency between 30 Hz and 100 Hz. If it is set to 30 Hz for example, the subwoofer will reproduce those frequencies below 30 Hz. Rotating the control clockwise will smoothly increase this frequency range up to 100 Hz.

In the bypass position, the crossover control has no effect. You should set this to bypass if your processor has its own subwoofer crossover frequency control.

If your processor does not have its own subwoofer crossover frequency control, rotate this control until the bass sounds natural. If the mid-bass sounds natural but you want more low bass, turn the crossover frequency down a little, then turn the volume up by about the same amount. This increases the low-bass output while leaving the mid-bass output the same.

9. Phase

This controls the relative phase of the subwoofer with respect to your other speakers. Use this to help blend the subwoofer with the rest of your system.

Adjust the control in small increments as you listen for the most bass at your listening position. As a final trim, readjust the crossover frequency and volume controls after the phase control has been set.

10. Volume

This control lets you match the output level of the subwoofer to the level of your satellite/main speakers. The subwoofer output will increase as this control is rotated clockwise. When installing your system, turn this down first before turning on your subwoofer, to prevent any loud surprises.

Installation

Observe the following general precautions and read the safety instructions on pages 2 and 3 before using your Subwoofer.

- Never open the cabinet or remove the metal control panel as this might result in an electrical shock to you or damage to the unit.
- Protect the subwoofer from prolonged exposure to direct sunlight and other direct sources of heat, such as heating vents and radiators.
- To prevent fire or shock, do not expose the unit to rain or moisture. If fluid or a foreign object should enter the unit, immediately turn off the power and contact your Dealer.
- Avoid excessive exposure to extreme cold or dust.
- Do not place heavy objects on top of the unit.
- Do not place the subwoofer with its control panel against the floor.

Heat

- Allow adequate ventilation around the metal control panel of the subwoofer.
- Let nothing come into contact with the panel and keep it at least two inches away from any walls.

The metal control plate serves as the amplifier heat sink, and also removes internal heat to the outside and into the atmosphere. It can reach temperatures of 60 degrees C, which feels hot to the touch.

AC Power Considerations

Ensure that the subwoofer is plugged into an outlet capable of supplying the correct voltage specified for your model.

Unplug your subwoofer's power cord from the electrical outlet whenever you leave the subwoofer unused for a long period of time.

Note: Never remove the ground pin from any power cords. This is very dangerous.

Route the power supply cord away from areas where it is likely to be walked on, or pinched by items placed upon it or against it, especially near the AC wall socket, any multi power strips, or near where the IEC cord attaches to the component.

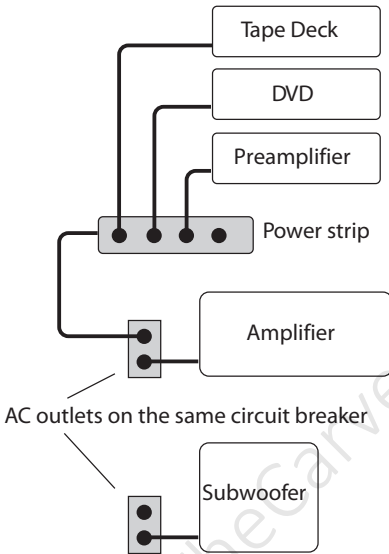

Magnetic Fields

We recommend that you place your subwoofer further than two feet away from your TV, VCR, tape deck or computer, so the speaker's magnet won't distort the colors of your TV picture or erase your video tapes, audio tapes or computer discs.

Connections

Please consider the following when setting up your new system :

- Before making or changing any connections, ALWAYS make sure that the subwoofer and your other components are turned OFF. Turn down the volume control of both the subwoofer and your processor or receiver.

- This diagram shows all the low power components sharing a power strip which is connected to the same outlet used by the main power amplifier.
- The subwoofer is connected to an outlet on the same circuit breaker, provided that the total system current draw does not exceed the breaker current rating.
- Whenever possible, keep the power cords away from the signal cables or speaker wires to prevent hum or interference.

- Choose reliable, high quality interconnect cables. They should be fully shielded and as short as possible for the job. The longest cable in your system will likely be to the subwoofer, so choose a good quality brand.
- Some cables can be a very tight fit and there is usually a preferred method of removing them. Some have to be removed with a twisting action. Be gentle, as twisting may cause damage to the jacks of the subwoofer or your other components.

Speaker-level connections

- The subwoofer's speaker-level inputs can accept speaker wires with banana, dual-banana, or bare wire. If you have banana-type connectors on your speaker wire, tighten the binding posts before inserting.
- Make sure that the negative speaker wires never touch the positive wires. This will short out and possibly damage your amplifier or receiver.

The subwoofer's two negative posts are joined internally (common-grounded). Your amplifier or receiver must also be internally common-grounded or you cannot use this connection. Contact the manufacturer of your amplifier or receiver to make sure its outputs are common grounded.

Location

Here is a neat trick to find the best subwoofer location for your room:

1. Start by placing it right on the seat of your favorite couch or easy chair. (This method is odd, but it is based on principles of acoustic physics).
2. If the subwoofer is part of a Home Theater system you can use the calibration test tone (pink noise) usually found in the processor/receiver's setup menu; or you can simply plug the outputs from a CD player directly into the subwoofer's line-level inputs, remembering to turn down the volume level on the subwoofer first, and then playing some of your favorite music samples containing heavy bass.
3. Walk around the room listening. Stand in all the locations where you might place the subwoofer. Try crouching down, particularly in the corners. Find the place where the subwoofer's bass output sounds the loudest.
4. Turn off the subwoofer and disconnect it from the power and from your processor/receiver or CD player. Next, install the subwoofer in the location you have just determined is best and remake all your connections.

Although low frequencies are non-directional, factors such as room reflections, standing waves, resonance and absorption will strongly affect your subwoofer's performance. Moving the subwoofer from one location to another can have a major effect on the bass response.

Magnetic Fields

Remember to keep the subwoofer at least two or three feet away from any TV screen, computer, VCR or magnetic tapes and discs. This will reduce the chance of the magnetic fields upsetting the TV screen or erasing your magnetic media.

Using two Subwoofers

If you wish to use two subwoofers, the sound output will double (an increase of 6 dB). Locate the subwoofers with one in each corner and experiment with the location and phase control to achieve the best bass response.

Always drive each subwoofer through the left line-level input even though you are driving one subwoofer with a right channel drive and the other with a left channel drive. If your preamplifier has a single sub/LFE output, use a Y cable to split it into two outputs.

System Configurations

The following pages show some typical connections that you might make in your installation. They show how the inputs and outputs of the Sunfire Subwoofer are connected to your preamplifier or receiver.

Connections to a preamplifier's subwoofer output

If your processor or receiver has a subwoofer output (Sub/LFE), it should be connected to the subwoofer's Left input as shown. This is the simplest and recommended connection.

If you have a Home Theater processor or receiver, it probably has an independent subwoofer volume and crossover control. If so, you should set the subwoofer's volume control to 0 dB, the crossover to Bypass, and use the processor's subwoofer level and frequency controls for adjustments.

Connections using Y cables

If your processor does not have a Sub/LFE output, you can use “Y” cables (or Y adaptors) to send its left and right main outputs to both the subwoofer and your amplifier.

The subwoofer will play the low frequency range, and your front speakers will play the full range.

Although bass is commonly distributed evenly between left and right channels (L+R bass), movie soundtracks often contain differential (L-R) bass. If this is not preserved, the bass in these scenes sounds anemic. The subwoofer utilizes differential gain on the left and right inputs to retain both the L+R and L-R information.

Systems that do not have a dedicated Sub/LFE output should use **both** the left and the right inputs as shown, for the greatest bass impact.

Using the line-level high-pass outputs

If you are using a receiver or processor which does not have a Sub/LFE output, you can send its left and right front output into the subwoofer's Line-Level inputs and then connect the subwoofer's High-Pass outputs to the inputs of your amplifier.

The subwoofer will play the low frequencies, and your amplifier and front speakers will play the frequency range above the subwoofer's fixed (70 Hz) high-pass crossover point.

The signals coming out of the subwoofer's high-pass outputs are not affected by any of the controls. They are just a copy of the signals going into the subwoofer except that the low bass is filtered out. This uses the subwoofer's passive crossover network, set at 70 Hz, rather than the active network and other controls.

This is an excellent method if your speakers are small satellites or mini-monitors, and/or your power amplifier is of limited power, such as a tube amp.

For the ultimate in computer sound systems, connect the left and right audio output from your computer sound card into the subwoofer inputs. Connect the sub's high-pass outputs to the inputs of your powered speakers. You may need some RCA-to-mini plug adaptors to make the connections. Adjust the sub's volume control to match low-powered speakers. See the note about magnetic fields on page 10.

Using the speaker-level inputs

If you are using a receiver which does not have a subwoofer output or line-level outputs (pre-outs), you can connect its speaker outputs to the subwoofer's speaker-level inputs. The front speakers can still be connected to your receiver.

The subwoofer's internal amplifier supplies the power to reproduce the low frequency range. It receives a sample of the signal going to your front speakers. (An insignificant fraction of your receiver's power is transferred to the subwoofer).

There is no need to use the speaker-level inputs if you are using a separate preamplifier/processor and a power amplifier. Such systems are best connected using the line-level inputs as shown in the previous diagrams. However, if you are using the line-level inputs and there is an excessive amount of noise or hum present, using the speaker-level inputs may yield a lower background noise level.

The subwoofer's two negative posts are joined internally (common-grounded). Your receiver/power amplifier must also be internally common-grounded or you cannot use this connection. Contact the manufacturer of your receiver to make sure its outputs are common grounded.

Adjusting the controls

There are two main methods for adjusting the volume, crossover frequency and phase controls to match a system:

- Preferred method: By listening and making the adjustments to suit your taste.
- Laboratory method: By measuring the output with a microphone and adjusting for a flat frequency response.

Excellent results can be obtained if you make the adjustments based on simply listening. This is our preferred method as it allows the system to be voiced based on what sounds the best, whereas laboratory-flat frequency response can often be clinical and less than exciting.

The following procedure is for those who prefer a more methodical and scientific approach. This excerpt is from "The Audio Critic," issue 24, page 31, written by contributing editor David Rich, and is reprinted here with their kind permission.

You will need a test CD with low-frequency warble tones, and a sound pressure-level meter. The Radio Shack® SPL meter will do fine, as will the *Stereophile*® test CD.

"Step 1. Disconnect the subwoofer and run the main speaker with a tone in its passband (80-100 Hz). Measure the level.

Step 2. Disconnect the main speaker and reconnect the subwoofer. Set the subwoofer to its highest crossover frequency. Set the volume control of the subwoofer to give the same sound pressure level with the same tone you used in Step 1.

Step 3. With both the subwoofer and the main speaker connected, measure the level of the tones at the available frequencies. Because the crossover is set too high, you will have a peaked response. Adjust the crossover control to get the smoothest response.

Step 4. Use the phase control to make the response even smoother. It has its biggest effect at the crossover frequency. You can iterate between the crossover and the phase controls. Keep your hands off the volume control! It was set correctly in step 2.

Step 5. Listen to the subwoofer. Resist all temptations to turn up the volume control. Play something with really deep bass to confirm that your subwoofer is working."

Record your favorite settings here:

Note:

Some Home Theater processors and receivers have an internal crossover adjustment which allows you to vary how much of the bass frequency range is sent to the subwoofer.

In these systems, it is recommended that you set your subwoofer's own crossover control to maximum frequency, or "Bypass." You can then make any crossover frequency adjustments using your Home Theater processor or receiver controls.

If the subwoofer's internal crossover is set to a frequency lower than the one on your Home Theater processor or receiver, there would be a hole in the mid-bass, and bass information would be missing.

Specifications

Amplifier Output

1,000 watts rms

High Cut Filter

30 Hz - 100 Hz adjustable. The crossover can be bypassed by rotating the crossover frequency control fully clockwise.

Frequency Response

HRS-8 22 Hz - 100 Hz
HRS-10 20 Hz - 100 Hz
HRS-12 18 Hz - 100 Hz

Power Line Voltage

120 VAC 50/60 Hz version
230 VAC 50/60 Hz version

Dimensions

HRS-8 10.0" (254 mm) cubed
HRS-10 11.5" (292.1 mm) cubed
HRS-12 13.5" (343 mm) cubed

Weight

HRS-8 28 lbs (12.7 kg)
HRS-10 34 lbs (15.4 kg)
HRS-12 38 lbs (17.2 kg)

Finish

High-gloss black cabinet, black anodized amp plate, black fabric grill.

Line power consumption:

600 watts average, at maximum continuous output, 18 to 100 Hz.
2,000 watts peak, time limited basis.

Output levels:

Peak SPL (including room gain):
HRS-8 102 dB
HRS-10 105 dB
HRS-12 108 dB

Input sensitivity for full output:

240 mVrms from left input with volume control at 0 dB, 90 mVrms with volume control fully clockwise.

0.48 Vrms from right input with volume control at 0 dB, 180 mVrms with volume control fully clockwise.

Input impedance:

30 K Ω for Line-Level inputs
5.6 K Ω for speaker or Hi-Level inputs

Drivers:

HRS-8 8" (203.2 mm)
HRS-10 10" (254 mm)
HRS-12 12" (304.8 mm)

Extra-large magnet and long throw mechanical design yields very high back-emf. The result is extraordinarily high operating efficiency – that is, more acoustic output for each watt of input.

Internal system gain:

42 dB from left input jack to subwoofer with volume control at 0dB.

54 dB with control fully clockwise.

36 dB from right input jack to subwoofer with volume control at 0dB,

48 dB with control fully clockwise.

Manual 913-140-00 Rev B

Troubleshooting

This subwoofer has been designed and built to provide years of trouble-free performance. Most problems that occur can usually be solved by checking your setup, or by making sure that the components connected to the amplifier are on and fully operational.

The following information will help you deal with common problems you may experience during normal use. If a problem persists, please contact your Dealer for assistance.

Not enough bass

- Check that your processor's outputs are connected to the subwoofer's line-level inputs and not to the line-level high pass outputs. If they are connected to the outputs by mistake, the bass will be weak but the subwoofer will still function.
- If your processor has a single subwoofer/LFE output jack, make sure it connects to the subwoofer's Left input. If the bass is still not enough after checking all the remaining points, use a Y cable to connect the processor's single subwoofer/LFE output to the subwoofer's left and right inputs.
- Try moving the subwoofer to a different location. See Location on page 10. Placing it in a corner will maximize the bass output and give the smoothest possible response.
- Home Theater processors usually have a way of adjusting the level of the subwoofer/LFE output, either using a remote control or with a small volume knob on the back panel. Make sure that this is adjusted correctly.
- Check that your processor or receiver's sub output is turned on. Some systems only have a sub output signal when the front speakers are set to "small."
- If the processor's Sub/LFE output has an adjustable crossover frequency, make sure that the subwoofer's own crossover point is set to Bypass or part of the bass range may be missing.

Not enough bass in a 5.1 system

- 5.1 Home Theater processors usually have a bass management system which allows the bass to be redirected among your speakers. For example, the bass normally present in the front speakers can be redirected to play in the subwoofer, or the subwoofer can play the bass from all the speakers, in addition to its dedicated LFE (low frequency effects) channel. Make sure that all of the bass management options are correctly set. The processor may have a way of turning the subwoofer output off entirely, so check that it is always on.
- Check that the processor calibration procedure is correctly adjusted. Usually, the preamp will send a test tone through all the speakers in your system, allowing you to adjust (trim) the volume of each channel until they are all playing at the same level.
- If the bass is weak only when playing 5.1 surround sources, check that your processor is correctly set to decode the 5.1 surround modes, such as Dolby Digital or DTS.
- Some DVD discs have a menu which allows you to select which soundtrack to play. Check that the correct 5.1 surround audio soundtrack is selected, otherwise it may just play stereo into your preamp and you won't get the true LFE signal into the subwoofer.

Hum

Adding any component such as a subwoofer to an existing system will often give rise to a hum which wasn't there before. Your first thought may be that the subwoofer has a problem, but this is more than likely caused by a "ground-loop" in your system.

Follow these steps to isolate the main cause of the ground-loop hum (there may even be more than one cause).

- Try to have all of your equipment on the same electrical outlet or circuit, provided that the total current draw does not exceed the current safety rating of the outlet or circuit.
- If your subwoofer is a fair distance away from your other equipment, you may use a 15 amp extension cord as long as it has a ground connection.
- Turn off all components in your system, including the subwoofer, amplifiers and the processor, before disconnecting or connecting cables.
- First remove every connection from the subwoofer to the rest of your system. Plug the subwoofer power cord back in and check for the hum. If it is still there, try plugging it into a different outlet in case it is picking up interference on the AC line.
- If you have followed the above guidelines for the power connections and a hum is still present, then there is one very common problem to consider: a "ground-loop" introduced by connecting a cable TV line to a VCR or TV, which is then connected to the preamp. This can be addressed as follows:
 - Disconnect all cables which come from outside the room, such as cable TV, satellite TV, or roof top antennas. Make sure that they are disconnected where they first enter the room, so they are making no connection to your processor, TV, or any other component. If the hum is caused by the cable TV line, then you will need a "ground-loop

isolator." This is an inexpensive device fitted in line with the coaxial cable feed.

- If the hum persists, disconnect all the source components one at a time from the back of the processor until you identify the problem.
- If you are using the subwoofer's line-level inputs and there is a excessive amount of noise or hum present, try using the speaker-level inputs as they may yield a lower background noise level.
- Ground-loop isolators are available for audio lines and video. Once you have identified which components are causing a problem, you can fit the isolators between the component and the preamp.

No auto turn off

- The subwoofer should turn itself off after approximately fifteen minutes with no audio signal present. If not, check there is no background hum. The subwoofer may sense hum as a small signal and stay on. See the above hints to eliminate the hum.

No auto turn on

- The subwoofer's volume control may be turned down or no signal is received from your processor.
- Check the input connections.
- Check on surround systems to be certain that a bass signal is being sent to the subwoofer.

Limited Warranty

Sunfire Corporation is proud of its products which have been built with care using advanced technology and premium component parts. Your unit has been crafted to perform properly for many years. Sunfire Corporation offers the following Warranty to you, the owner of a new Sunfire product:

The Sunfire Corporation Warranty for the HRS Subwoofer is in effect for ONE year from the date of original retail purchase. The Sunfire Corporation Warranty covers defects in materials and workmanship. The following, however, are excluded:

- a) Damage caused during shipment.
- b) Damage caused by accident, misuse, abuse of operation contrary to the instructions specified in the Sunfire Corporation user's manual
- c) Units where the serial number has been defaced, modified or removed,
- d) Damage resulting from modification or attempted repair by any person not authorized in writing by Sunfire Corporation.
- e) Units purchased from unauthorized dealers.

The Sunfire Corporation Warranty extends to the original owner or subsequent owner(s) during the one year warranty period so long as the original dated purchase receipt is presented whenever warranty service is required.

All implied warranties, including warranties of merchantability and fitness for particular purposes, are limited in duration to the one year length of this Warranty, unless otherwise provided by state law.

Sunfire Corporation's liability is limited to the repair or replacement, at our option, of any defective product and shall not in any event include property or any other incidental or consequential damages which may result from the failure of this product.

Some states do not allow limitations on how long an implied warranty lasts and/or do not allow the exclusion or limitation of incidental or consequential damages, so the above limitations or exclusions may not apply to you.

This Warranty gives you specific legal rights, and you may also have other rights which vary from state to state. We suggest that you attach your purchase receipt to this Warranty and keep these in a safe place. Thank you for your choice of a Sunfire Corporation product.

Service Assistance

We suggest that you read the Limited Warranty completely to fully understand your Warranty/Service coverage.

If your Sunfire Corporation product ever requires service, write to us, or call:

Sunfire Corporation
Technical Services Department
P.O. Box 1589
Snohomish, WA 98290
Tel (425) 335-4748
Fax (425) 335-4746

You will be directed to an authorized Sunfire Corporation Service Station or receive instructions to ship the unit to the factory. Please save the original shipping carton and packing materials in case shipping is required. Please do not ship Parcel Post.

NOTE: Before sending in your unit for repair, you must call Sunfire for return authorization (RA).

Include a complete description of the problem, indicating how you have it connected, the associated equipment in your system and a copy of your purchase receipt. Initial shipping costs are not paid by Sunfire Corporation; return ground shipping costs will be prepaid if repairs were covered by the scope of this Warranty.
